

Best to **protect your plant** from cold weather

Description

Powerful greenhouse heater , compact, energy-efficient & safe in operation - all these are features of the new Palma heater with digital thermostat by bio green. Its robust housing is constructed largely from stainless steel. With its timeless design, this floor-standing heater looks good in any situation. Palma is also the ideal solution for the smaller greenhouse where space is at a premium. Thanks to its compact design, slip-resistant rubber' & practical carrying handle, it can be used almost anywhere. The technology that we have developed ensures that the temperature is maintained reliably at a reasonable level with no energy-wasting temperature peaks in the greenhouse. The energy savings that are made are not due to half-hear-ted heating but to sensible use of the available energy. Heating a greenhouse – the challenge To keep a greenhouse frost-free, the temperature must remain above 32°F even in the corners. If the current of air does not reach there, then the temperature on the heater has to be really high, however, then a large proportion of the warmth goes up into the gable of the greenhouse, where it is not needed, while the corners may still dip down to minus temperatures. This is unsatisfactory, because heating energy is being wasted.
